Data Sharing Agreement Date

April 17, 2017

Summary of Research

The authors wish to publish a case report on a single child who accidentally ingested a 5 mg dose of apixaban, including the measured level of the drug 17 hours post-ingestion. They plan to compare this with data apixaban levels in healthy adults the same length of time after ingestion of a 5 mg dose, published in 2012. The hypothesis is that the 17-hour apixaban level measured in the case report will be similar to the average 17h levels seen in healthy adults in the study published in 2012.

Study Design

Since this is a case report, there is no study population, and the sample size is one. No statistical analysis will be performed.
